

Creating Windows Instance

Step 1

Register for an Amazon Web Services account at <http://aws.amazon.com/>.

Then Login to AWS Amazon

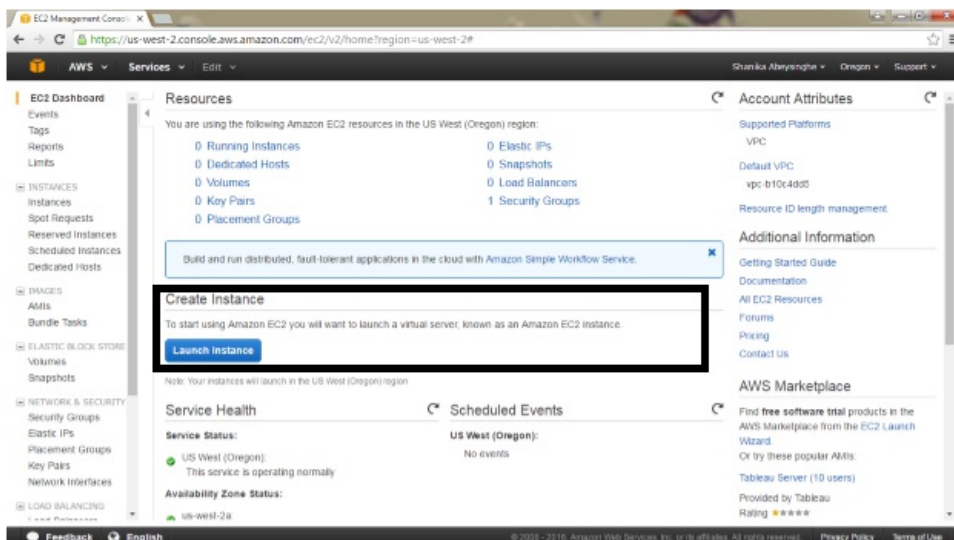

Step 2

Enable EC2 feature Cloud for AWS account at <http://aws.amazon.com/ec2/>.

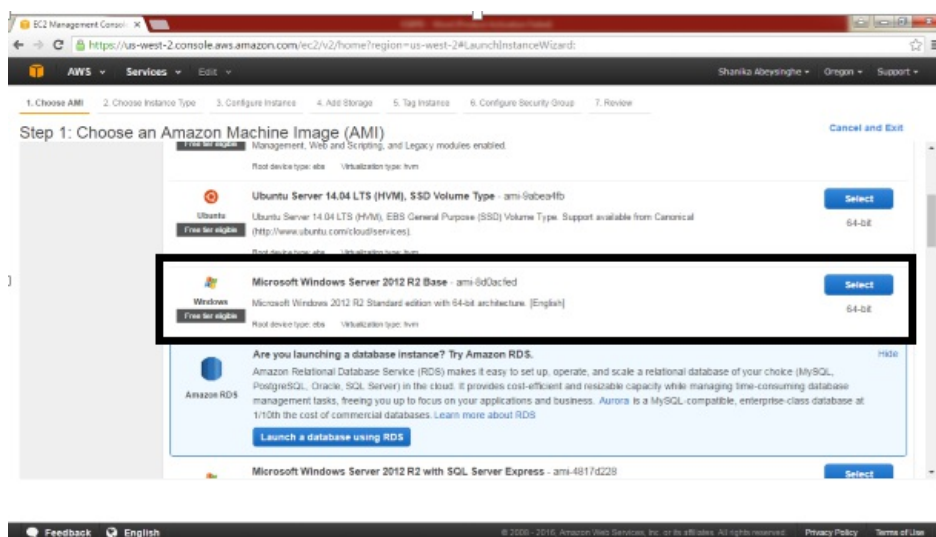

Getting started with Amazon Windows instance

1. Create a EC2 windows instance in Amazon Web Services
2. Click the Launch Instance Button under the "Create Instance" section.

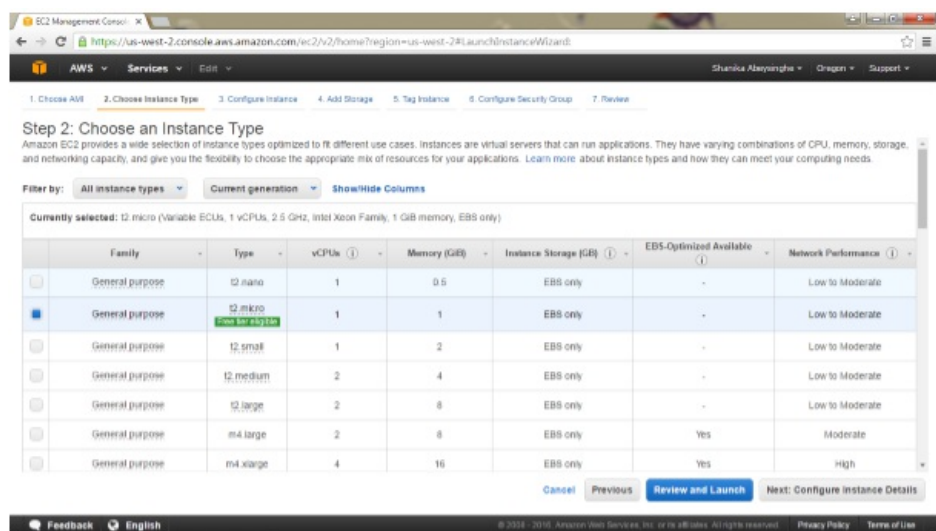

Step 3

Select Microsoft Windows Server 2012 R2 Base (free tier eligible one) as the AMI. Just choose "select" out of the list.

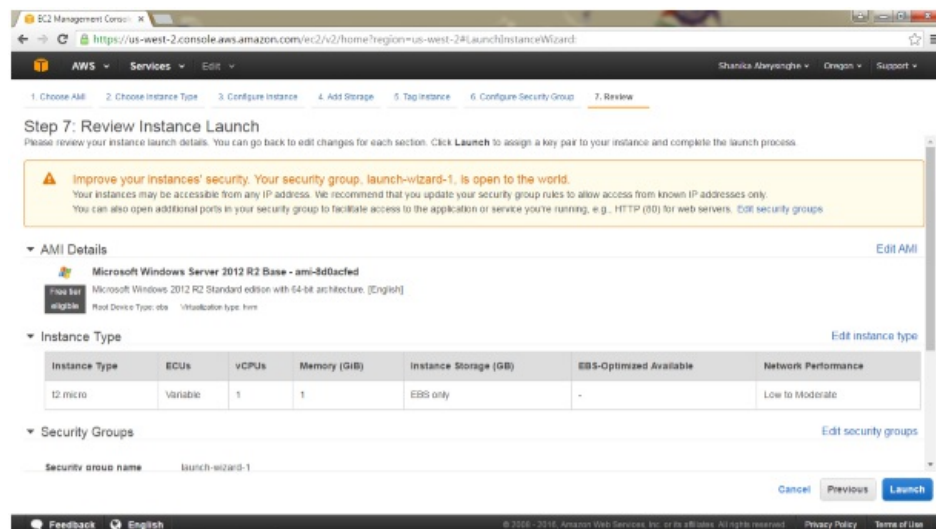

Step 4

Choose t2.micro as the instance type. And click on the configure instance details button

Step 5

Click on the Launch button Under Security Groups

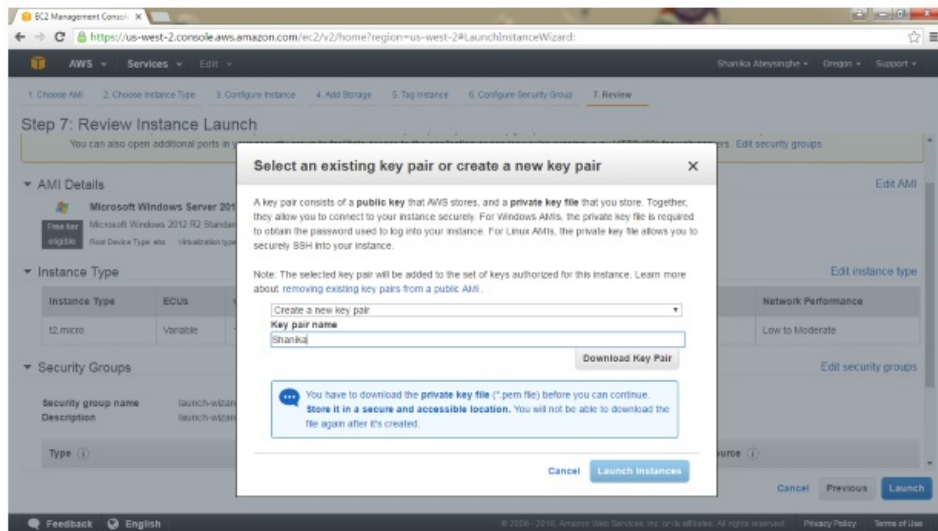

Step 6

Create a new key pair and download the key pair.

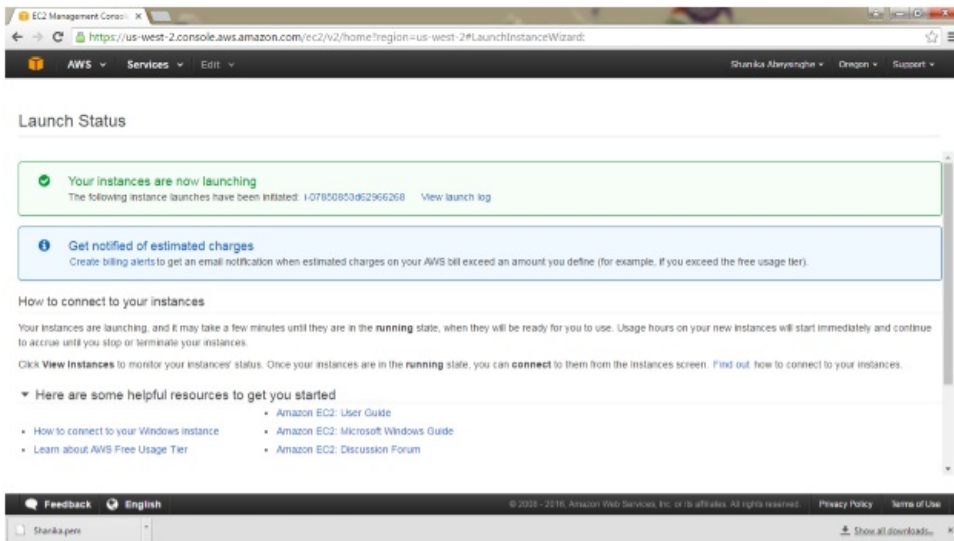

Use the Request Instances Wizard to configure the newly created instance which includes configuring the security, choosing an encryption key, opening ports in the firewall, and kicking off the new instance.

Then launch the instance.

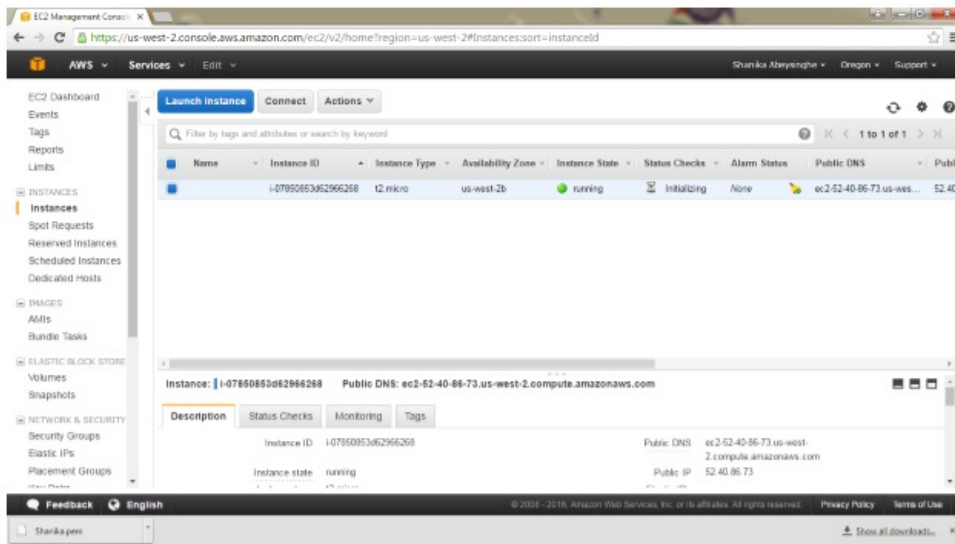

Step 7

Then the launch status will appear.

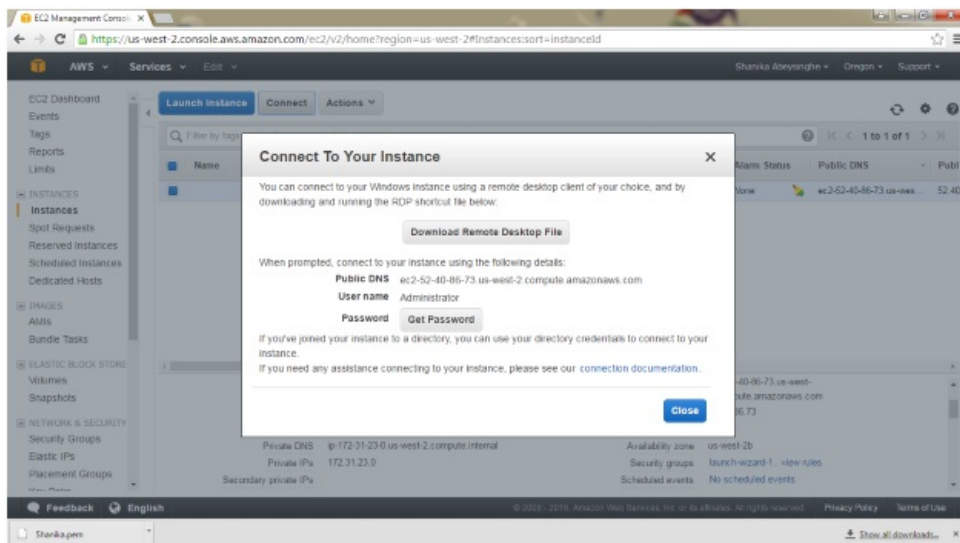

Step 8

Now the instance is running.

Step 9

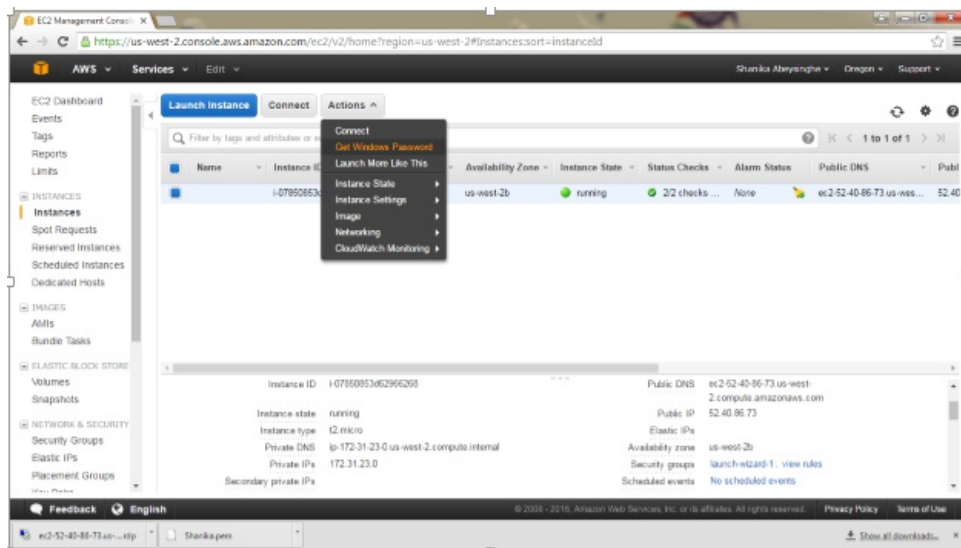

Click on the Connect button to connect to the instance.

Step 10

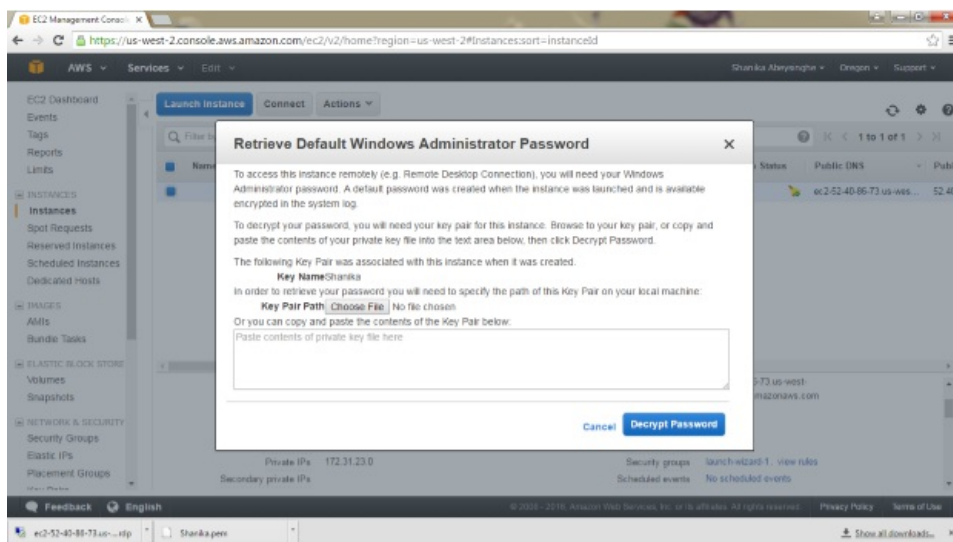

Now we want to login. the system was created with an administrator account which has a strong password. we need to retrieve that password using the "Instance Actions -> Get Windows Admin Password" option.

click on the Get Password button

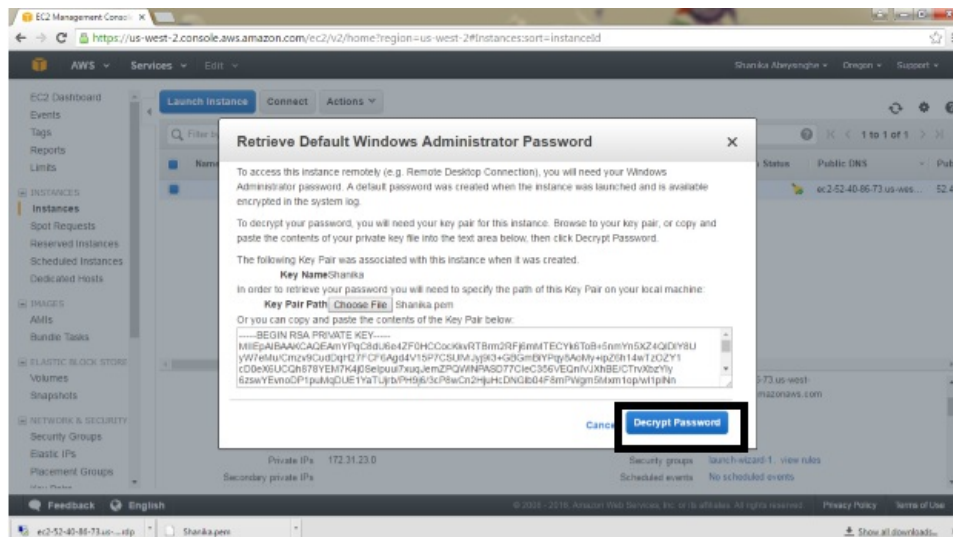

Step 11

After click on the Get Password button, this interface will appear.

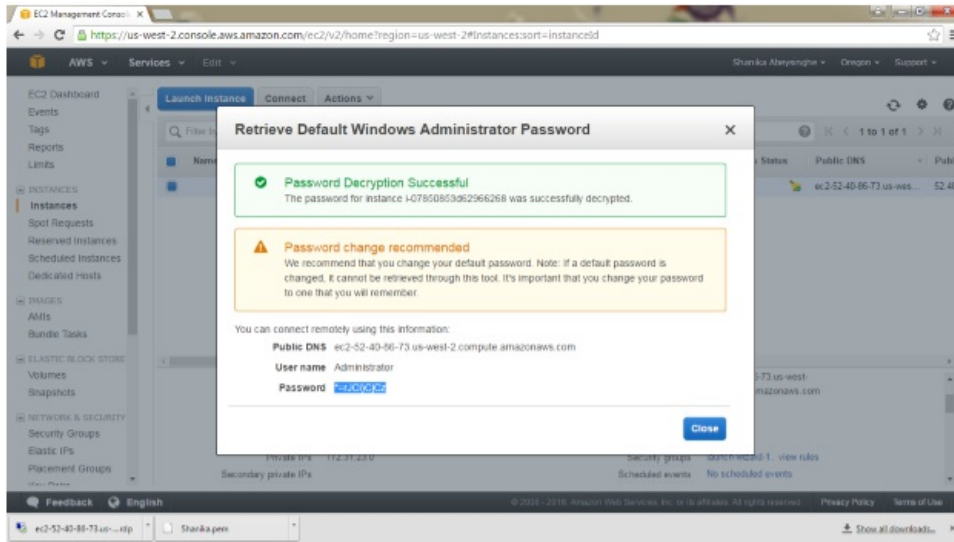

Step 12

Choose the downloaded .pem file.

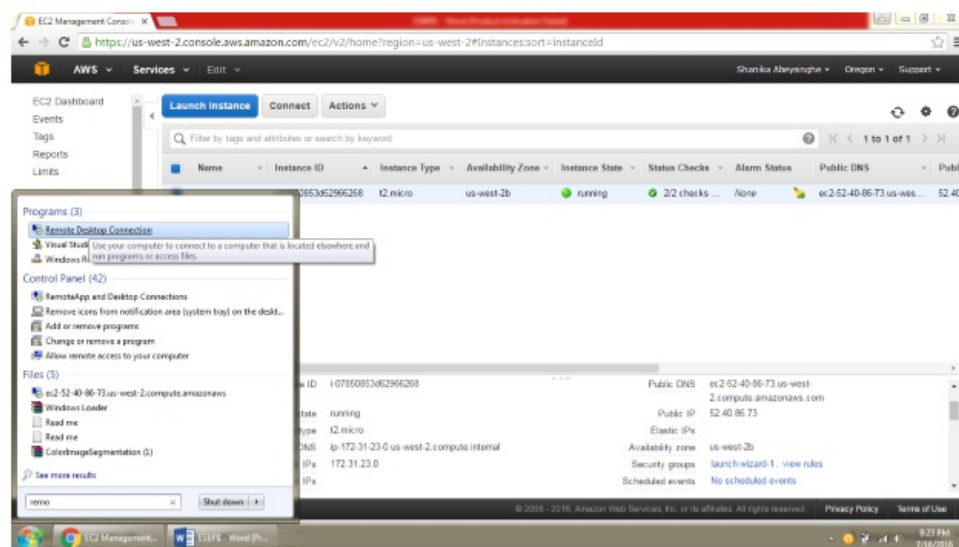

Step 13

Then decrypt the password. Decrypted password will appear.

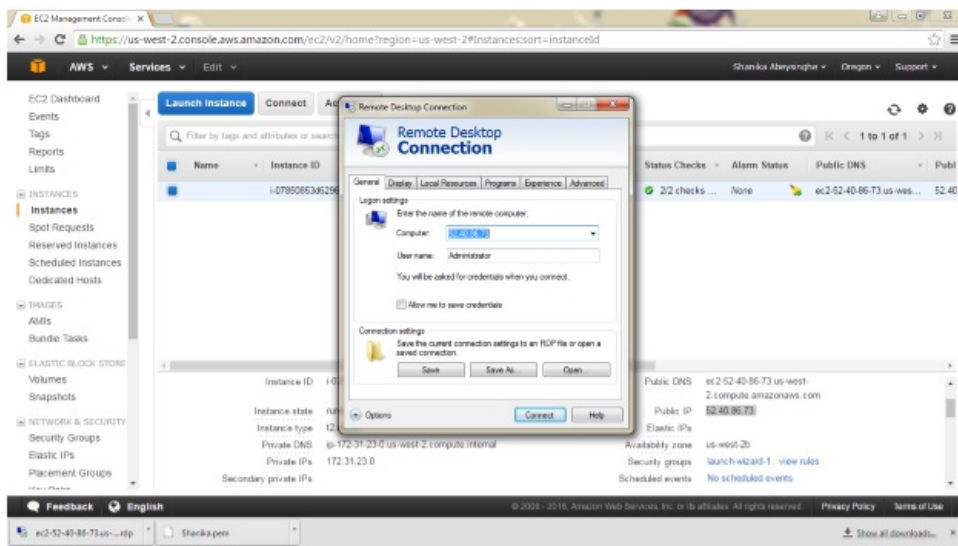

Step 14

Search the Remote Desktop Connection.

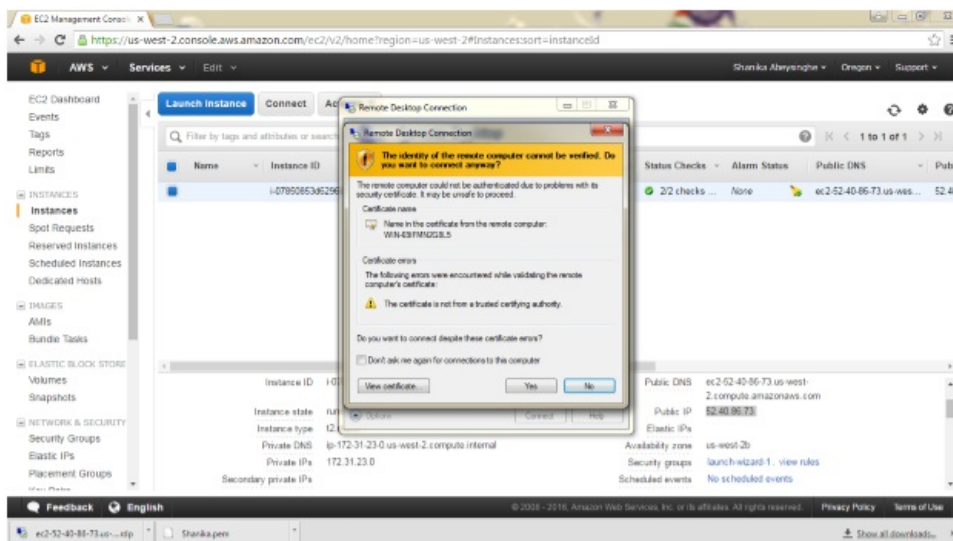

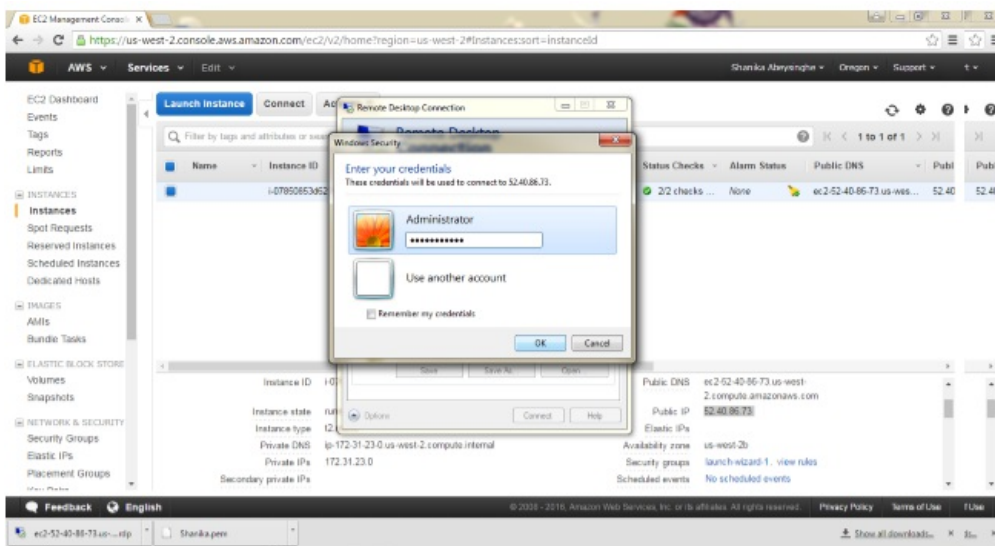

Step 15

Give the public IP of Instance as the remote computer IP. And click on the Connect button.

Step 16

Enter the credentials. Username- Administrator, Password- the decrypted password.

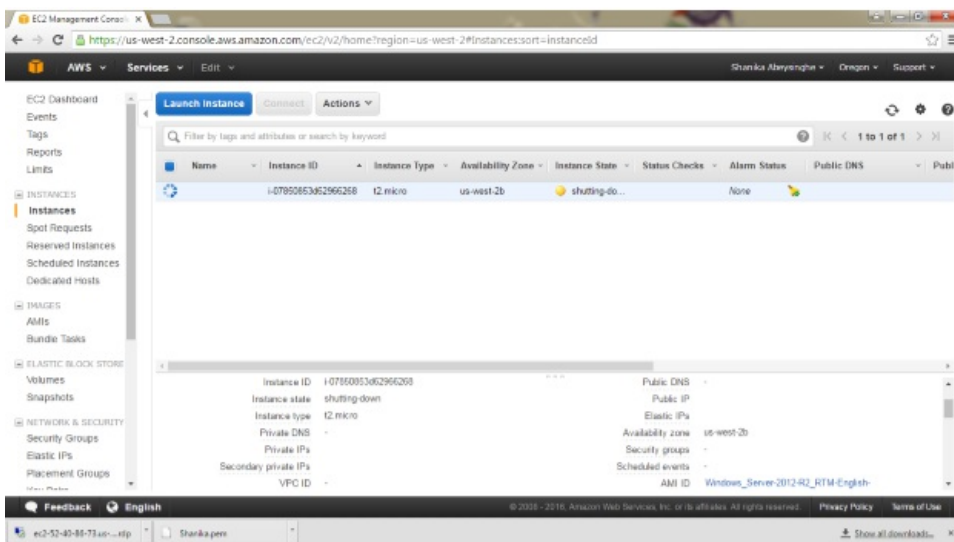

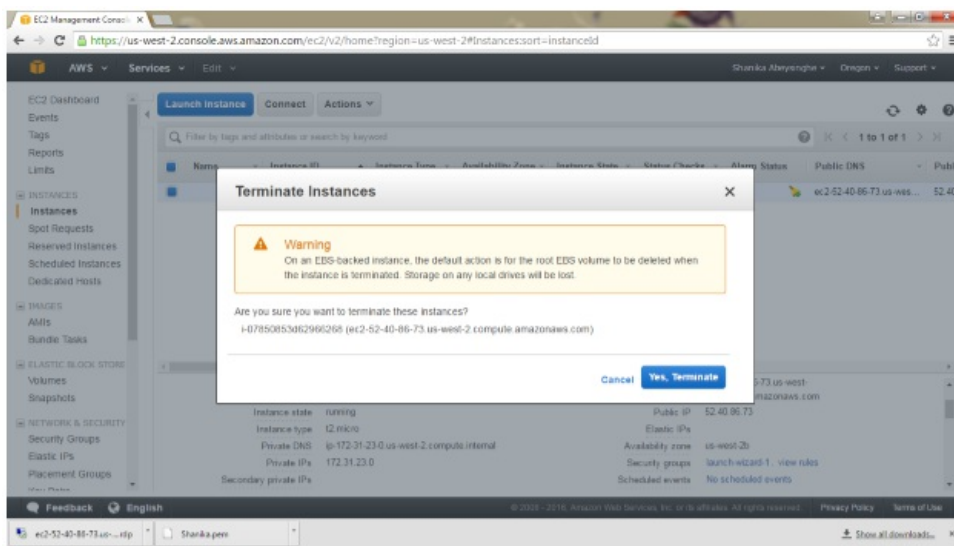

Step 17

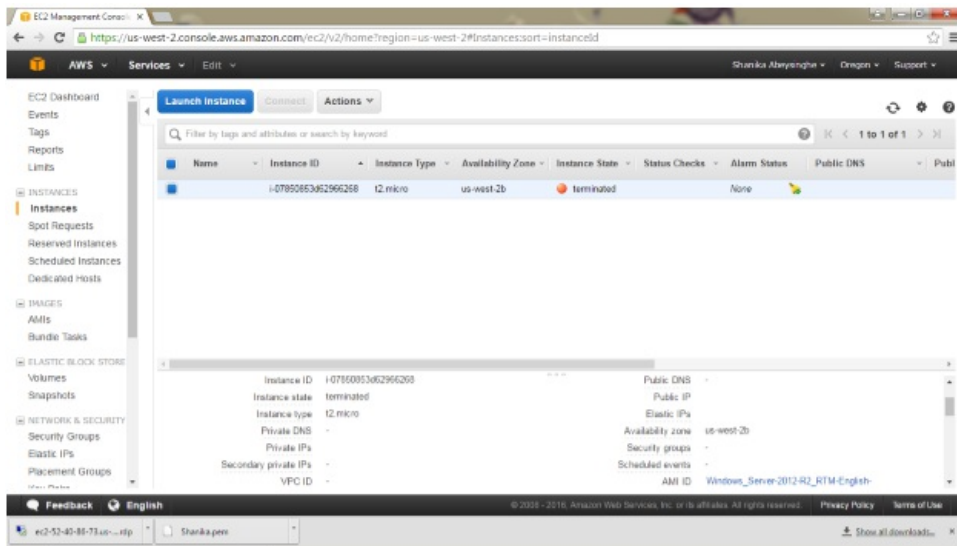

Click yes and your Windows instance will appear.

Step 18

Finally we have to terminate the windows instance.

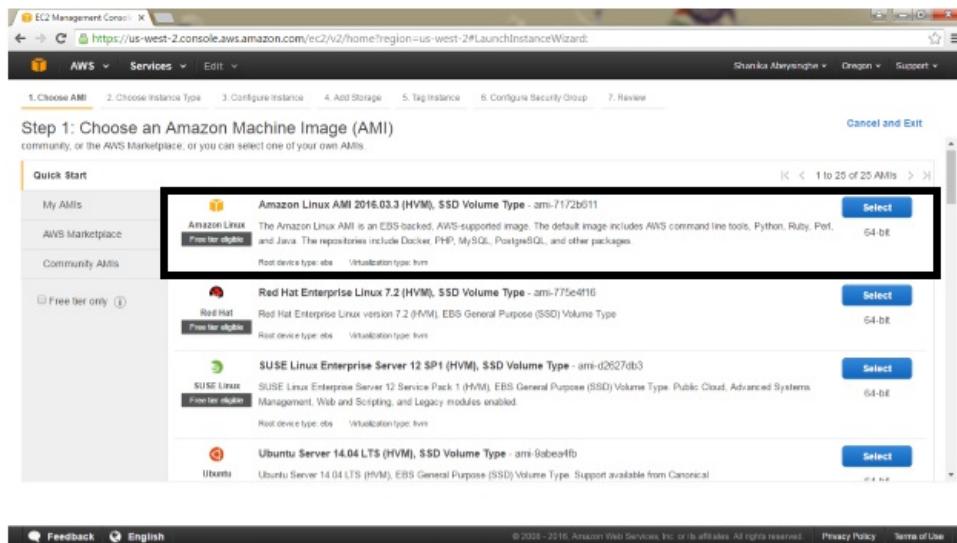

Creating Linux instance

Launch an Amazon EC2 Instance as previous done step 1 and step 2 of creating window instances

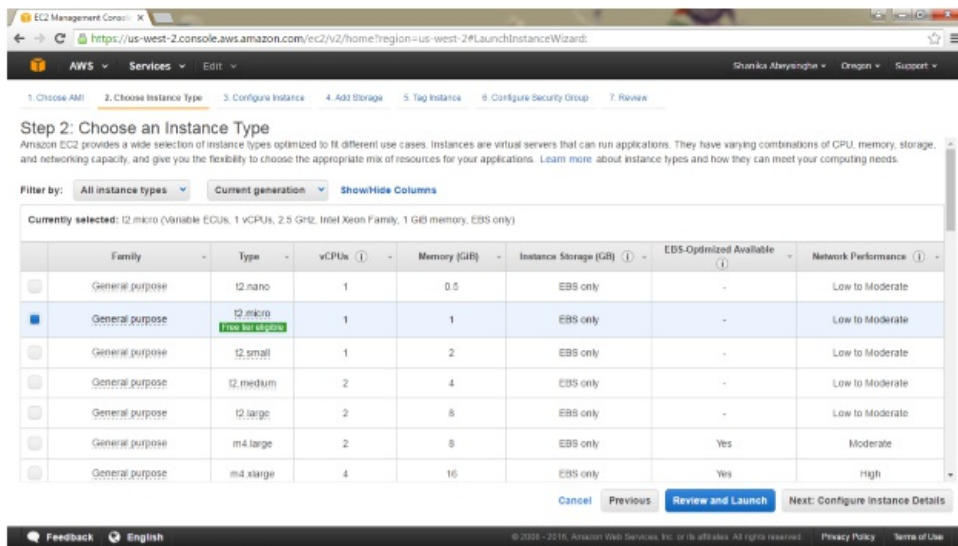

Step 1 and Step 2

Choose an amazon Machine image (AMI) as Amzon Linux AMI Select Amazon Linux AMI or Red Hat Enterprise Linux.

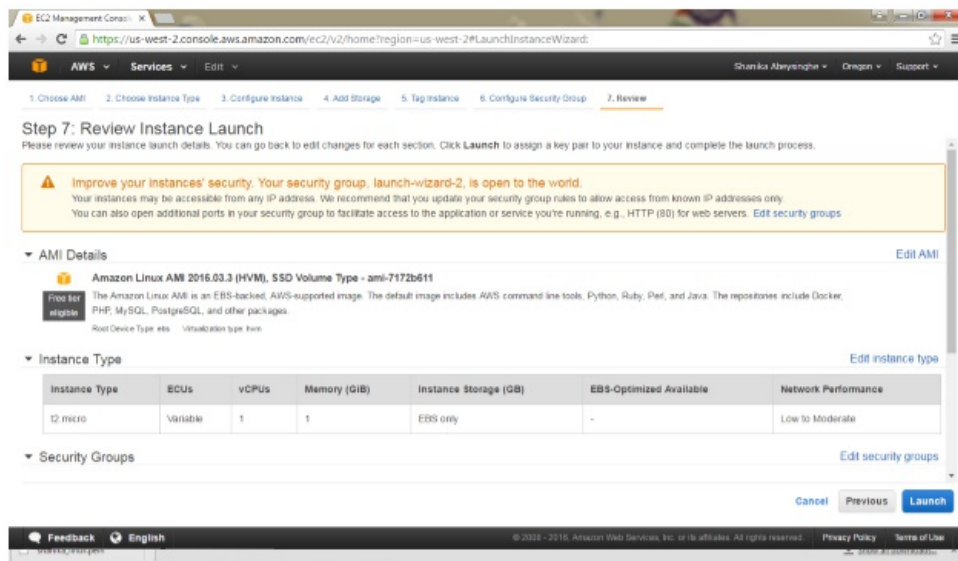

Step 3

The default option of t2.micro should already be checked. This instance type is covered within the Free Tier and offers enough compute capacity to tackle simple workloads. Then Click **Review and Launch** at the bottom of the page.

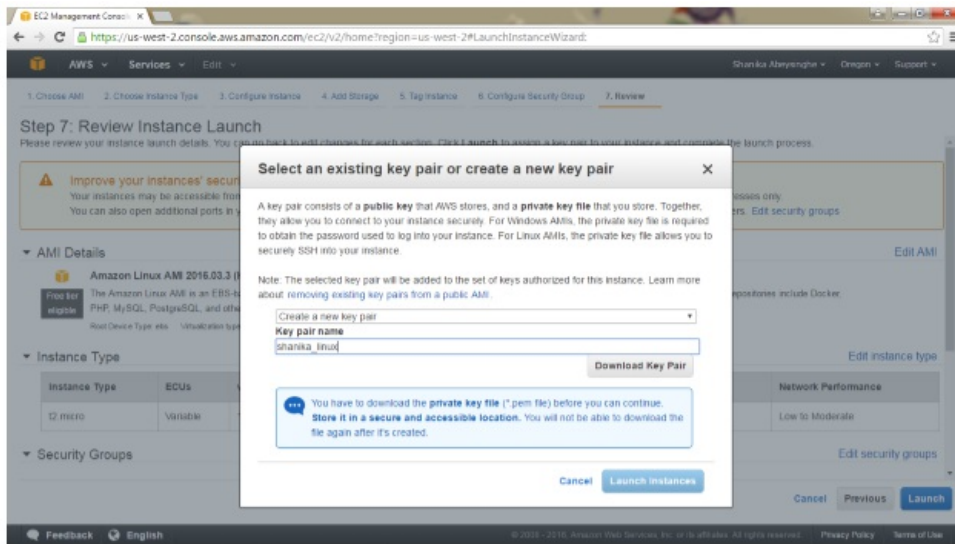

Step 4

After Clicking by the **Review and Launch** button it will appear the **Review Instance Launch** window . Then Click the **Launch** button under the **Security Groups**

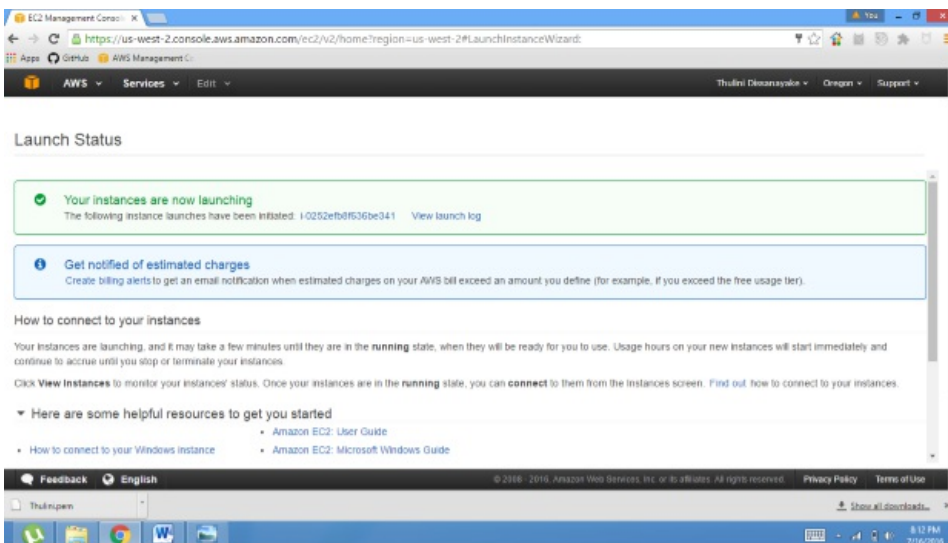

Step 5

On the next screen it will be asked to choose an existing key pair or create a new key pair. Select Create a new key pair and give the Suitable name for it. Next click the Download Key Pair button. Then Click on the **Launch Instances** Button.

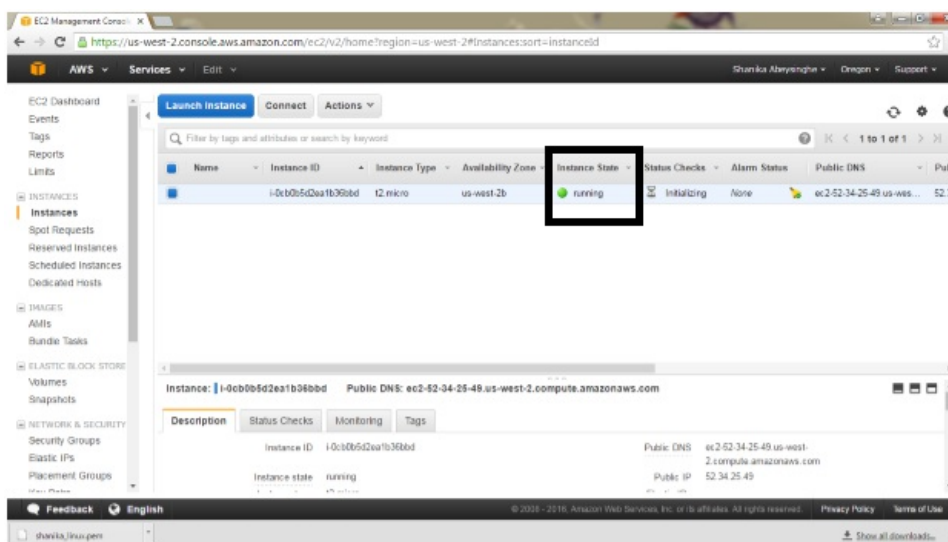

Step 6

Then it will appear **Launch Status** window. After few minutes it will launching the instance.

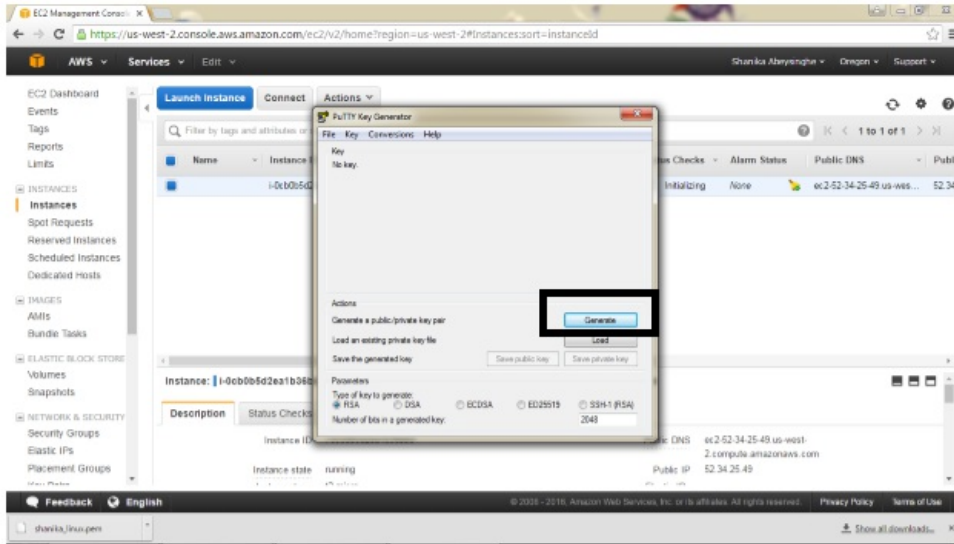

Step 7

Now instances are launching and it will take few minutes to change instance state to running state.

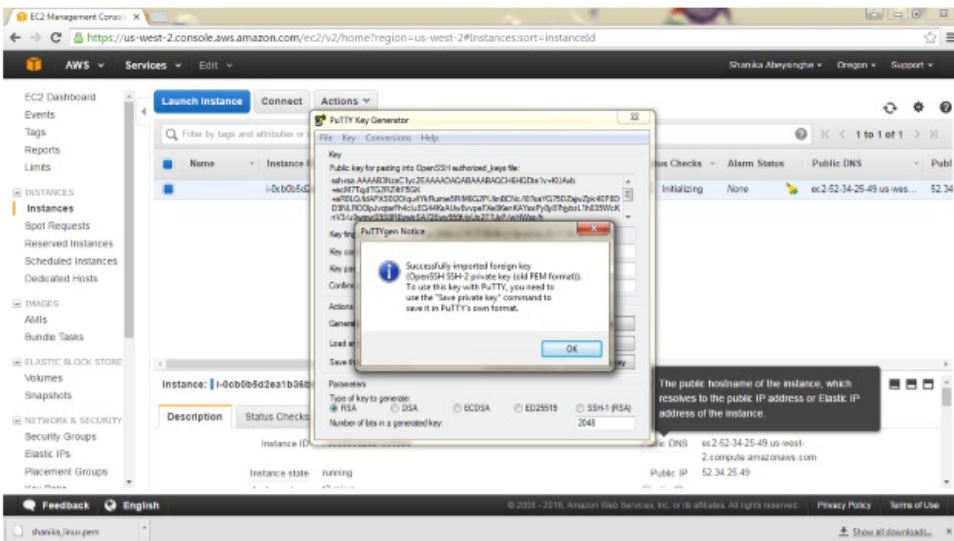

Step 8

Now we should have to run puttykey Generator to get the public key. then Click the **Generate** button

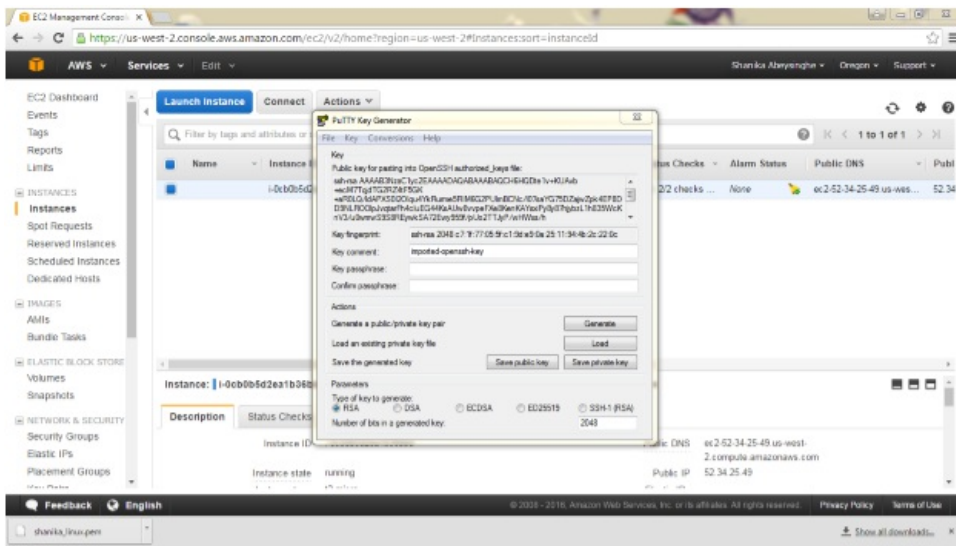

Step 9

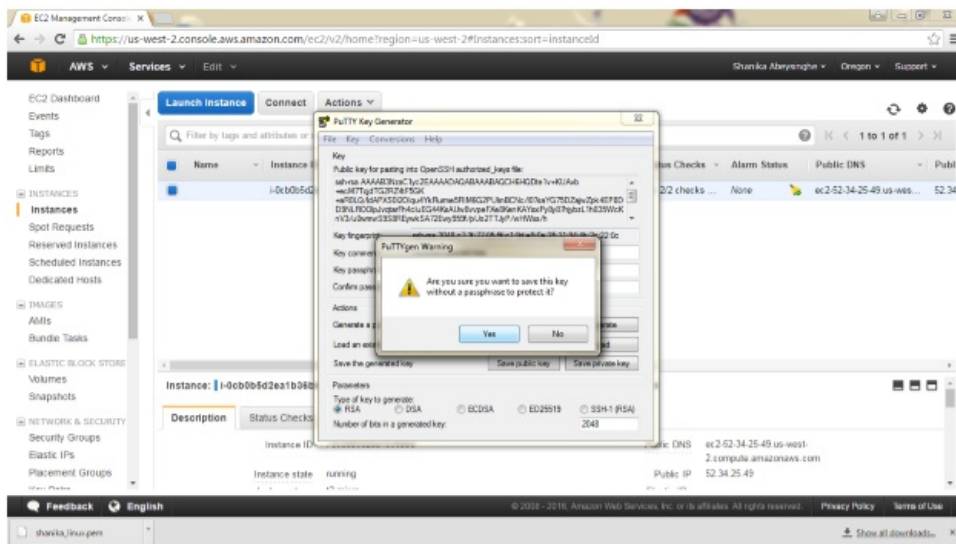

Now load the private key we downloaded in the puTTY and load it in to Key by clicking the **Load** button

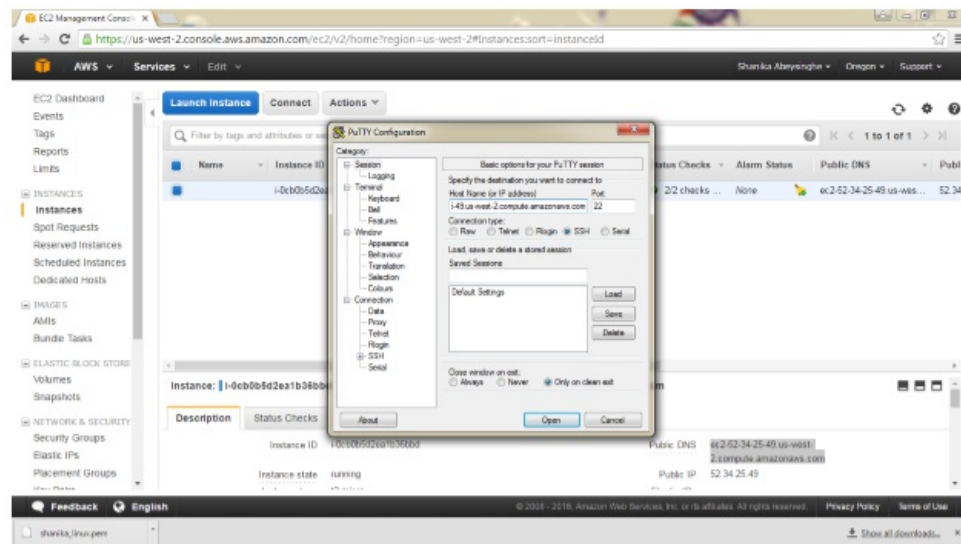

then we have to save the key. to do that click on the **Save Public key** button

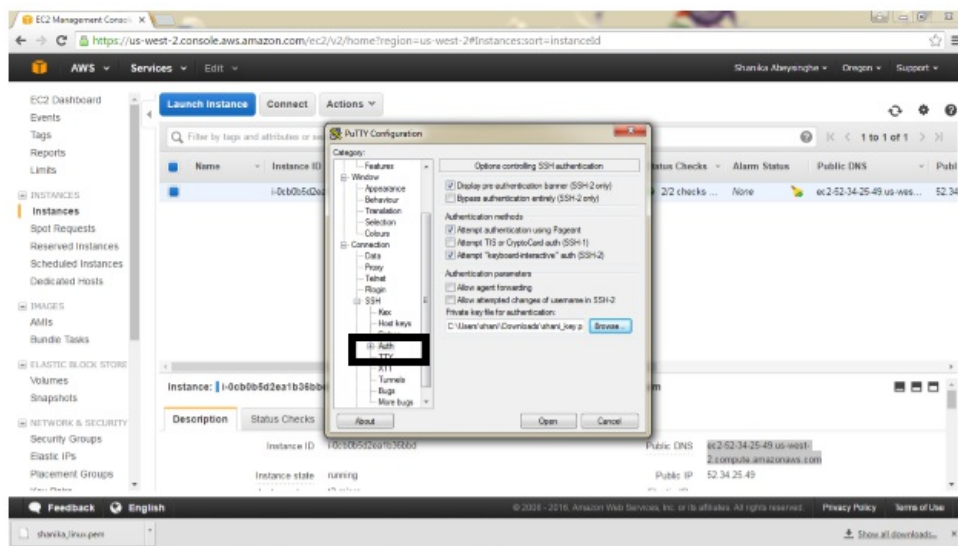

Then run the puTTY Configuration software.

In that we have to select the Connection field under the Category. and select the Auth

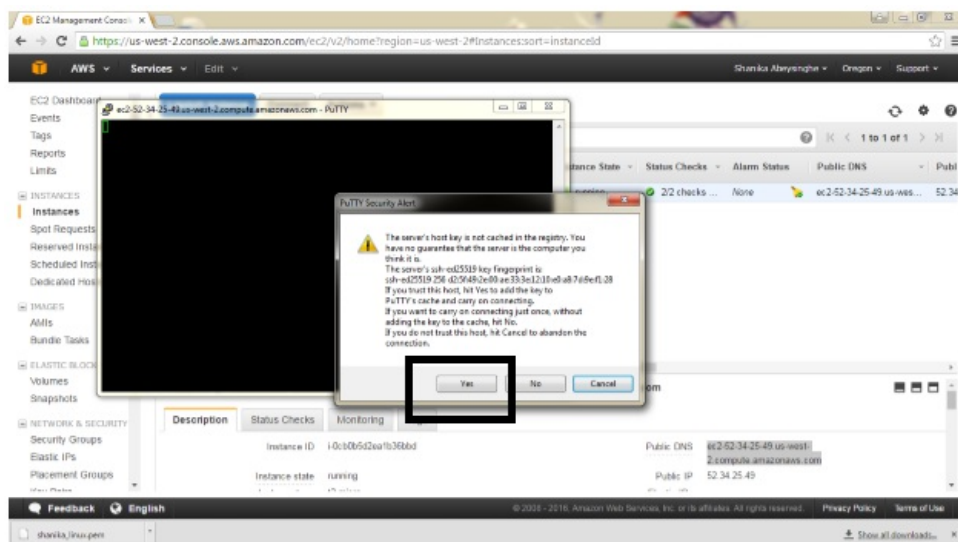

Then under that field we have to browse the download key pair(.pem file) and then click open.

Step 10

Now it will appear the console. It will show the PuTTY security alert and in that message click on the **yes** button

Step 11

Now console appeared. then we have to give login as --> ec2-user

Step 12

Now it will Authenticate the public key and open the Amazon Linux AMI

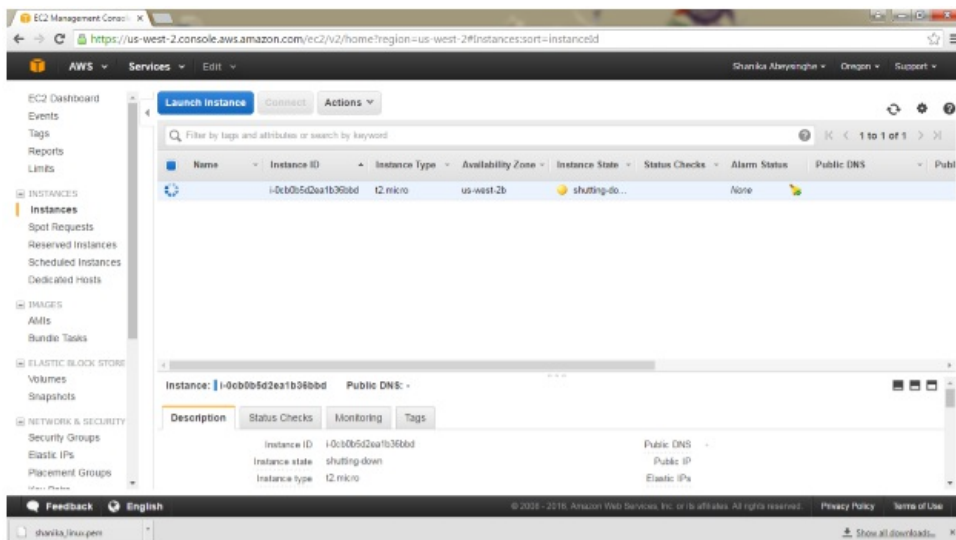

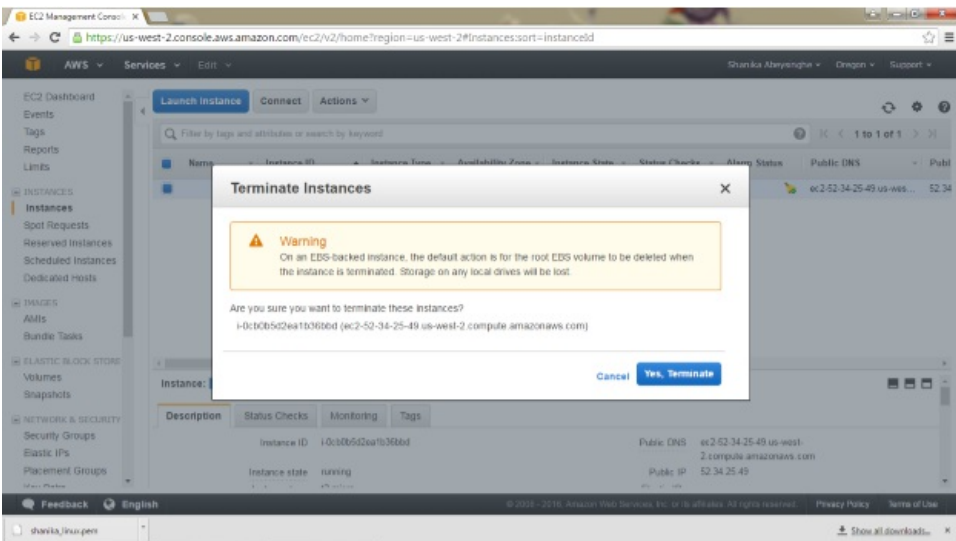

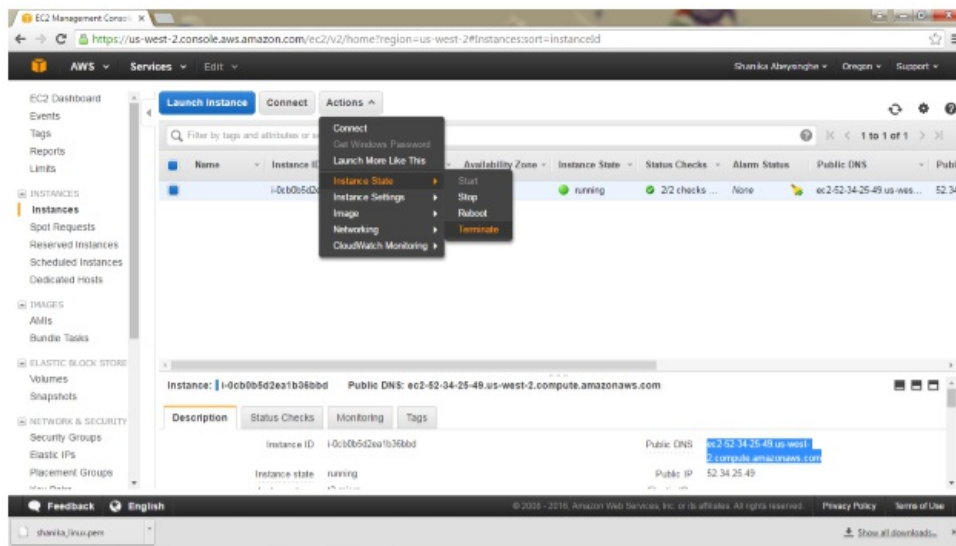

Step 13

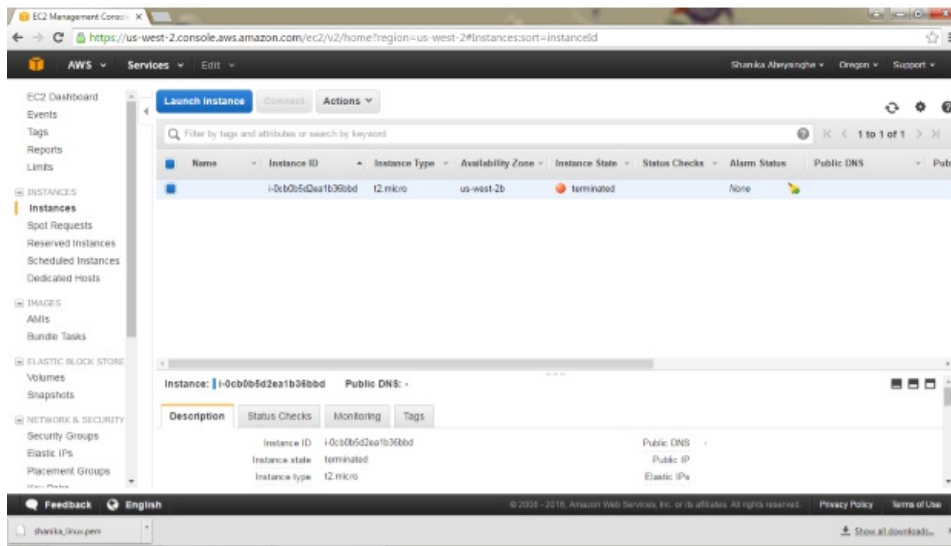

Now we can type our commands here

Step 14

Finally we have to terminate the windows instance.

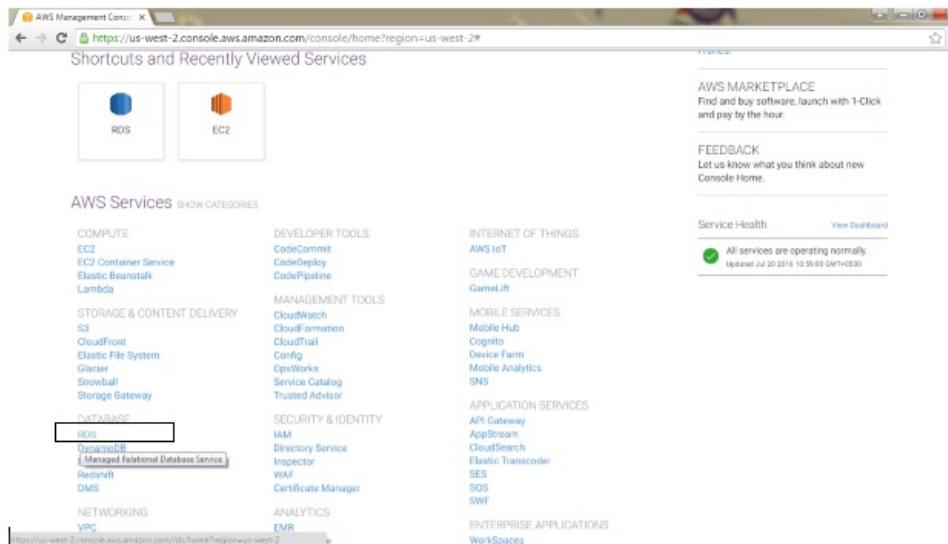

Creating a MySQL database instance

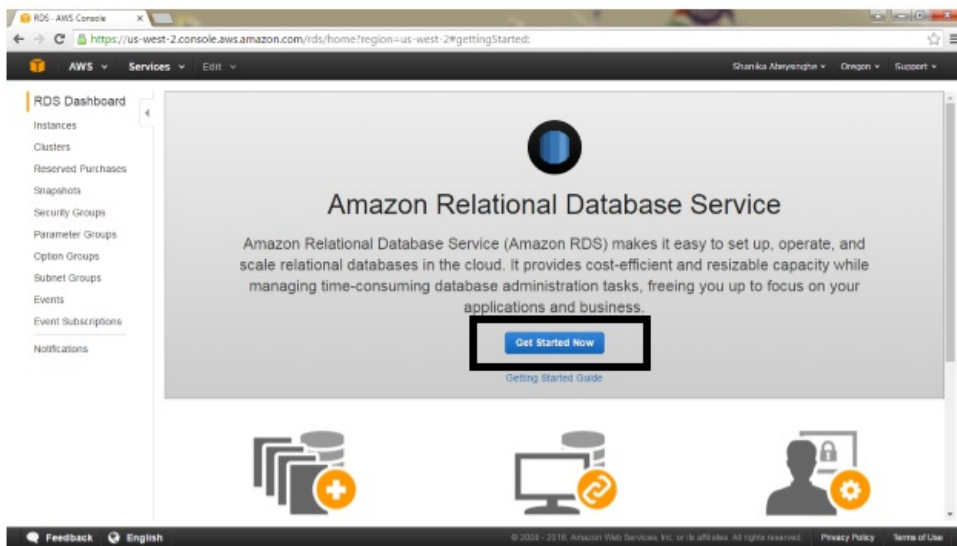

Step 1

sign into the AWS Management Console and open the Amazon RDS under Database category

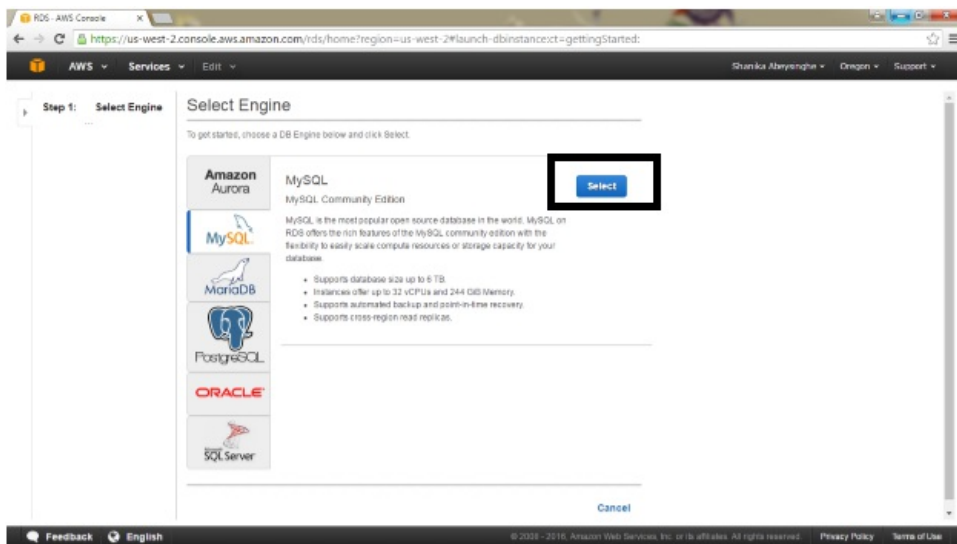

Step 2

Now it will appear RDS dash Board and we have click on the **Get Started Now** button.

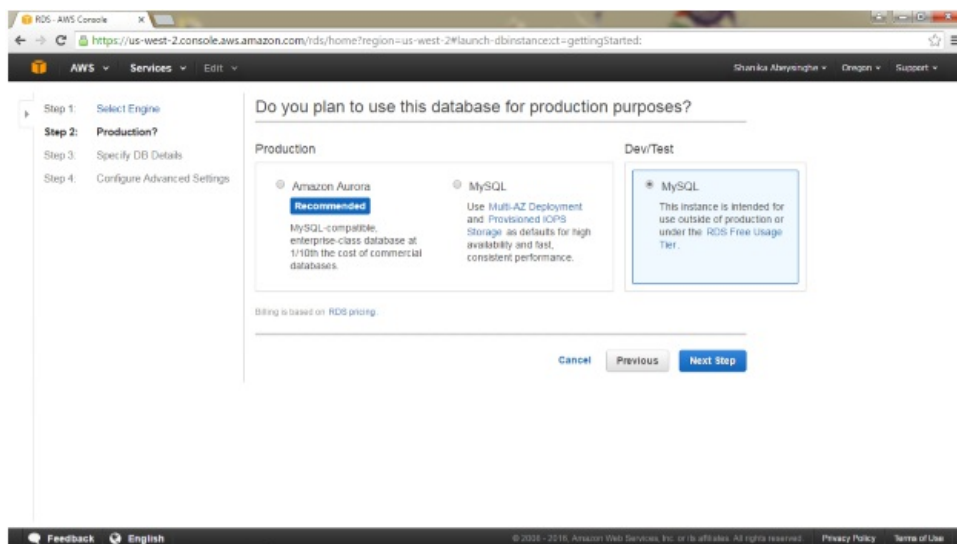

Step 3

Now select the MySQL as select engine. then Click on the Select button

Step 4

Then Click mySQL under Dev/Test and click on the New Step

Step 5

Then we have to specify the DB Details

- DB Engine Version: Use the default engine version
- DB Instance Class: db.t2. small
- Multi-AZ Deployment: No
- Allocated Storage: 15 GB
- DB Instance Identifier*: Test1
- Master User Name*: Shanika

then choose suitable password as master password and click on the next button

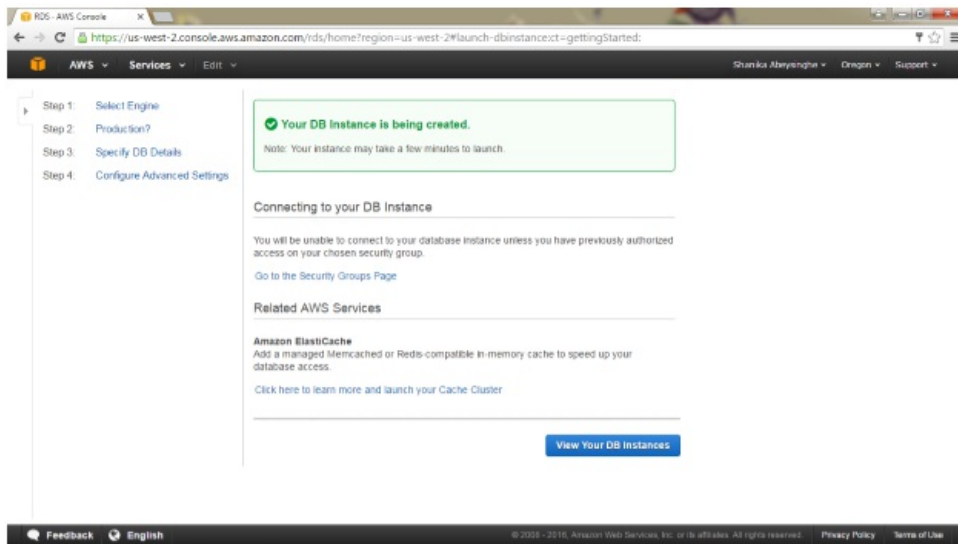

Step 6

write Database name as Test1 under Database Options and click on the launch Button

Step 7

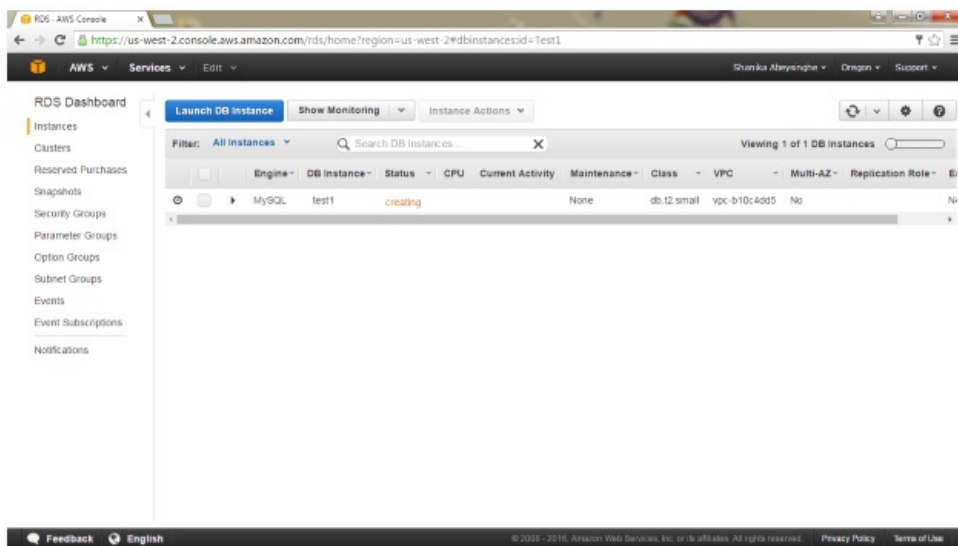

Now DB instance Being Created

now select the **View Your DB Instances** button

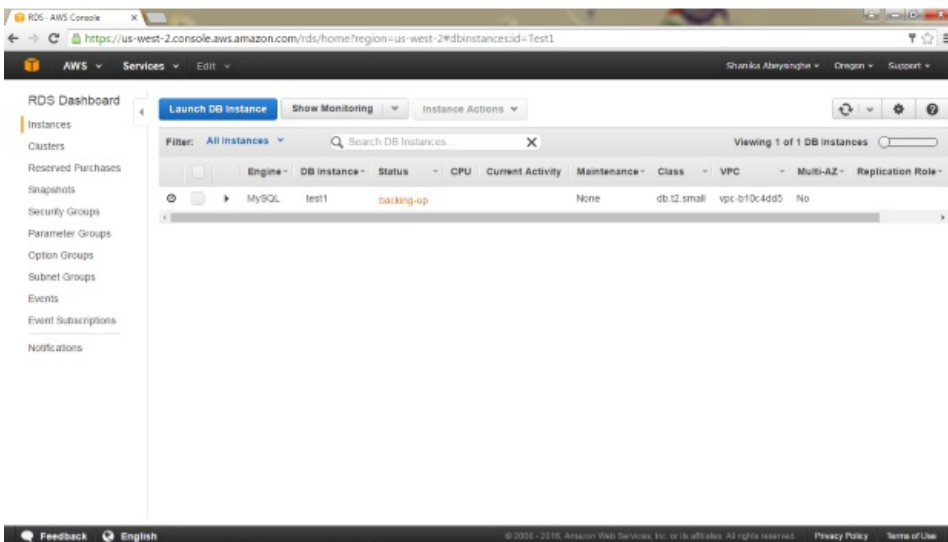

Step 8

Now DB instance is Creating

Under Instances option of the left navigation menu, monitor your new DB instance until the status changes from creating to available.

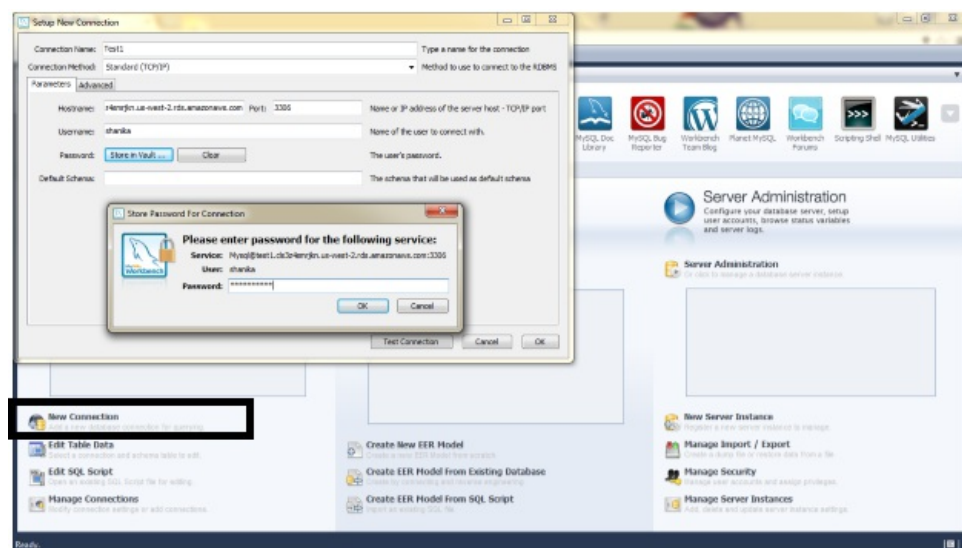

This may take up to 5 minutes as the database is being created and backed up.

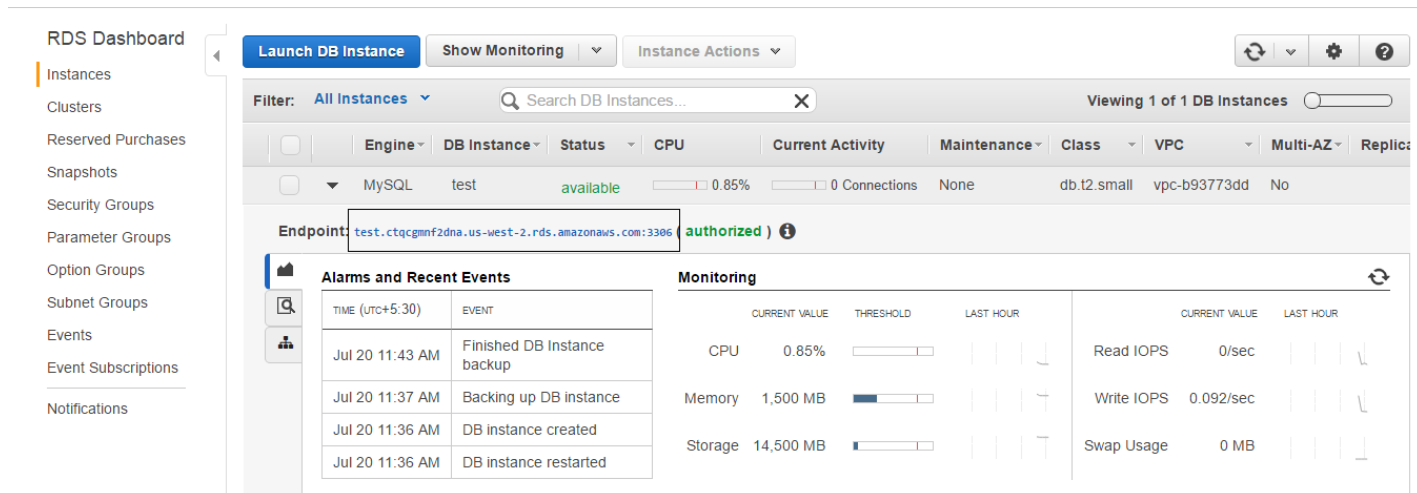

Step 9

Once your RDS instance is available, we are ready to use this newly created MySQL database instance (in the cloud) from our MySQL workbench. To do this open the MySQL work bench.

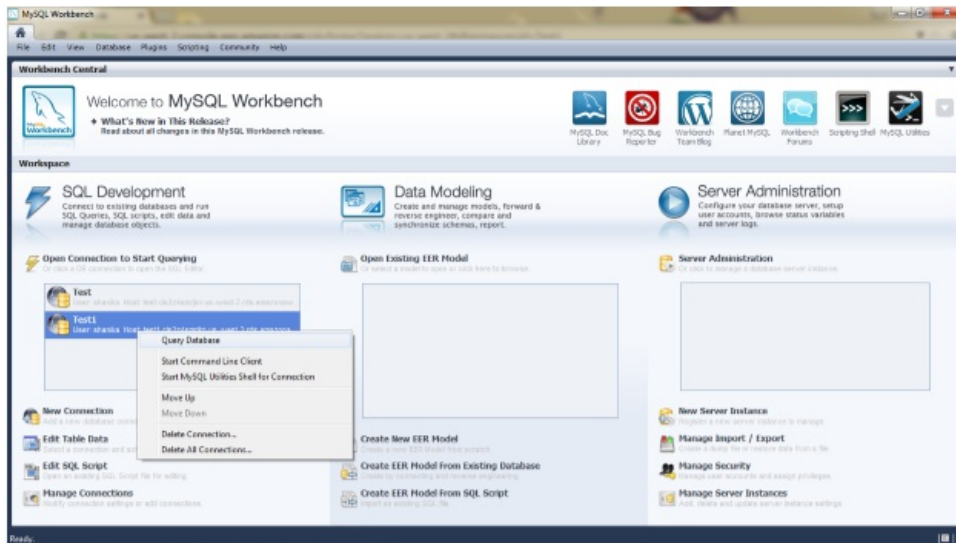

then select **New Connection** button

To set up New Connection, Connection Name - Test1 Host Name - End Point name of DB identifier Then click on the **Store In value** and then it will appear message box asking for password. then we have to enter the master password here and click OK

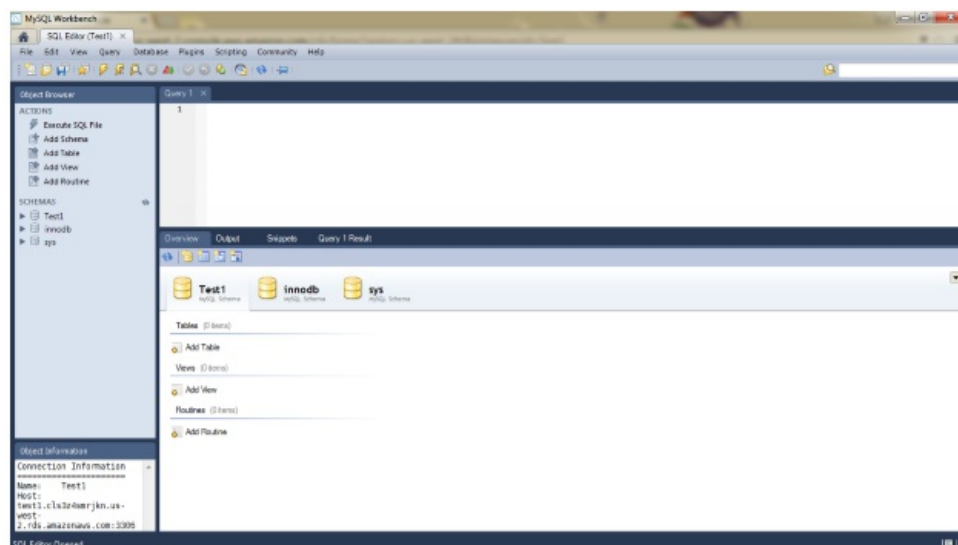

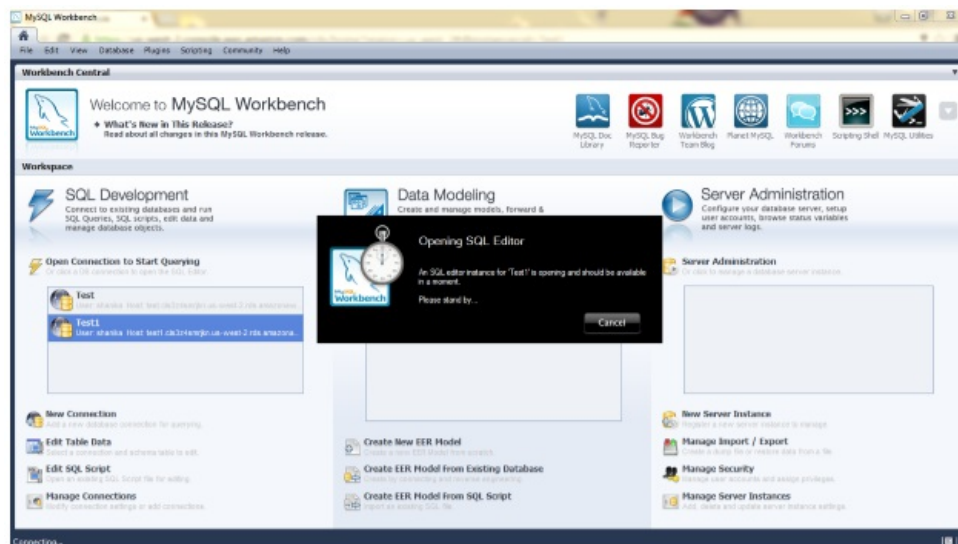

Step 10 Now database Connection will established and we can query it.

Step 11

Now it will open SQL editor and we can Query in that

Now created Instance Should be deleted from the Instance

RDS Dashboard

Delete DB Instance

Are you sure you want to Delete the test1 DB Instance?

Create final Snapshot? Yes

Final snapshot name test1-final-snapshot

We strongly recommend taking a final snapshot before instance deletion since after your instance is deleted, automated backups will no longer be available.

Amazon Relational Database Service (RDS) is a web service that makes it easy to set up, operate, and scale a relational database in the cloud. We currently offer MySQL, SQL Server, Postgres and Oracle engines, allowing you to use the code, application and tools you already use with your existing database with Amazon RDS. You can find pricing information for RDS [here](#). Click the Launch DB Instance button to get started.

Note: Your DB instances will launch in the US West (Oregon) region.
